

ASSIGNMENT 2

1

GROUP 21

**SOPHIE RAIN (01425316),
LUCAS UNTERBERGER (01325438),
PETER STROPPA (01326468).**

datasets

2

- **WINE**
- **MUSHROOMS**
- **CONGRESS**
- **AMAZON**

datasets overview

3

| Dataset | # samples | # attributes | Missing values? | # classes | classes eq. important? | Types of attributes |
|-----------|-----------|--------------|------------------|-----------|------------------------|---------------------------|
| Amazon | 750 | 10 000 | no | 50 | yes | ordinal |
| Congress | 217 | 18 | yes (unknown) | 2 | yes | categorical (2 values) |
| Wine | 1599 | 11 | no | 11 | no | numeric |
| Mushrooms | 8124 | 22 | yes | 2 | no | categorical (2-10) |

methods

- K-Nearest-Neighbors
- Support Vector Machines
- Random Forest

pre-processing

5

scaling and selection

- Min-Max-Scaling
- Z-Score-Scaling
- Feature Selection
- Handmade weighted scaling

encoding

- Ordinal Encoding
- One Hot Encoding
- TF-IDF

pre-processing

6

Weighted scaling

TF-IDF

If correlation < 0:

- $$\frac{\max(\text{feature}) - \text{feature}}{\max(\text{feature}) * |\text{correlation}|}$$

If correlation > 0:

- $$\frac{\text{feature}}{\max(\text{feature}) * |\text{correlation}|}$$

results

7

| Best result | <u>kNN</u> | <u>Random Forest</u> | <u>SVM</u> |
|-----------------|------------|----------------------|--------------|
| Wine | | perfectly | perfectly |
| Congress | | | 97% accuracy |
| Mushroom | perfectly | perfectly | perfectly |
| Amazon | | 67% accuracy | |

conclusion

8

different datasets

- kNN really good for clustered data
- SVM highly depend on kernel
- Don't forget human intuition

Diffrent methods

- SVM & RF outperformed
- kNN troubles with many classes
- RF profits of heterogeneous data
